## General

The Standard-Signal-Panelmeter S9648 has been designed for measuring industry standard signals 0/4 ... 20 mA or 0 ... 10 V DC. The device offers an integrated transmitter supply for direct connection of 2- and 3-wire transmitters for e.g. pressure or temperature. The connection of potentiometers is possible as well. Indicating range and decimal point are free programmable in the range  $\pm 9999$  (standard) or  $\pm 99990$  (fixed zero selected).

## Short information

Programming	Parameters are programmed via front-side membrane keypad.
Alarm outputs	Switching performance min. or max., hysteresis, on-delay time and off-delay time are programmable in range from 1 s up to 9 h.
Digital filter	With activated digital filter last 16 measured values will be averaged continuously and the result shown in the display.
Analog output	Proportional to the input signal an isolated analog output signal 0 ... 20 mA/0 ... 10 V DC or 4 ... 20 mA/2 ... 10 V DC can be generated. Output changes automatically from current signal to voltage signal depending on burden.
2nd measuring input*	The device can be offered with a 2nd measuring input at the terminal strip B, for measuring difference-, average value, smaller or larger value. Please ask for further information.

\*Note: no isolation between input 1 (terminal strip A) and 2nd measuring input

## Controls and indicators

### Description

Operation of the device is arranged in 2 levels. While programming, pressing the button  saves the current parameter and moves to the next programming step. For selection within a parameter or for entering data, use buttons  and .

After powering up, the device is located in the **Working level**. Set points of the alarm outputs can be preselected if available.

Pressing the button  for more than 2 seconds, activates the **Configuration level**. Now all the parameters which defines the function of the panelmeter can be programmed.

After finishing the configuration or when no button was pushed for more than 2 minutes, the program returns to the working level. Leaving the configuration level is possible at any time by pressing the button  for more than 2 seconds.

Parameter display as status indicator for the alarm outputs A1-A4.

Segments f (A1 / A3) and/or b (A2 / A4) are flashing with 2 Hz, when delay time is active.

Segments e (A1 / A3) or c (A2 / A4) are output indicators.

### Error codes:

Display flashes      Overflow of the display range

*Error 1*      EEPROM test. Reading this message, a program error has been occurred. When pushing the button  a copy of the EEPROM will be reloaded and the device will work with the factory settings. If this copy does not work, please ship the panelmeter to factory for repair service.

*Loc*      Programming lock active ( see configuration page 7)

### Start-up note:

Before setting into operation, the device must be configured for the intended use.

=> see page 6

## Notes to representation

Parameter is only displayed when configured

Parameter is only displayed when feature is included (see order code)

**Please Note:** All parameters can be called if they are not blocked by other programmed parameters and if they are available. **Factory settings** are shown in the display.
